Application No. 10/716,312 2 Docket No.: LMR-12002/16

Amendment dated October 11, 2006 Reply to Office Action of September 11, 2006

AMENDMENTS TO THE CLAIMS

1. (Original) An arm motion assembly for an exercise device, said assembly

comprising:

a first link which is pivotally supported by a first frame portion of said exercise device at

a first pivot point so that said first link is capable of reciprocal motion about said first pivot

point;

a second link which is pivotally supported by a second frame portion of said exercise

device at a second pivot point spaced from said first pivot point so that said second link is

capable of reciprocal motion about said second pivot point; and

a connector link which extends between said first link and said second link, said

connector link having a handgrip, said connector link being pivotally joined to said first link at a

first junction point, and to said second link at a second junction point so that when said first and

second links pivot about their respective pivot points, said handgrip travels in a reciprocal path of

travel.

(Original) The assembly of claim 1, wherein said connector link includes a rocker

arm portion which projects therefrom in an angled relationship and wherein said second link is

pivotally joined to said connector link through said rocker arm portion.

3. (Original) The assembly of claim 1, wherein the location of the first junction

point is adjustable relative to the first link or the connector link.

Application No. 10/716,312 3 Docket No.: LMR-12002/16 Amendment dated October 11, 2006

Reply to Office Action of September 11, 2006

4. (Original) The assembly of claim 1, wherein the location of the second junction

point is adjustable relative to the second link or the connector link.

(Original) The assembly of claim 1, wherein the location of the first pivot point is

adjustable relative to the first link or the first frame portion.

(Original) The assembly of claim 1, wherein the location of the second pivot

point is adjustable relative to the second link or the second frame portion.

7. (Original) The assembly of claim 1, wherein the length of at least one of the first

link, the second link and the control link is adjustable.

(Original) The assembly of claim 1, wherein the handgrip portion is capable of

pivoting relative to the remainder of the control link.

9. (Original) The assembly of claim 1, wherein the first link is a swing arm which is

configured to be attachable to a foot link so as to direct a first end of that foot link in a reciprocal

path of travel.

10. (Original) The assembly of claim 1, further including a synchronization link

which is pivotally connected to said first link.

Application No. 10/716,312 4 Docket No.: LMR-12002/16 Amendment dated October 11, 2006

Reply to Office Action of September 11, 2006

11. (Original) An arm motion assembly for an exercise device, said assembly

comprising:

a first link which is pivotally supported by a first frame portion of said exercise device at

a first pivot point so that said first link is capable of reciprocal motion about said first pivot point

when said exercise device is in use;

a second link which is pivotally supported by a second frame portion of said exercise

device at a second pivot point spaced from said first pivot point, said second link including a

handgrip; and

a connector link which extends between said first link and said second link, said

connector link being pivotally joined to said first link at a first junction point, and to said second

link at a second junction point; so that when said first link reciprocates about said first pivot

point, said connector link causes said second link to pivot about said second pivot axis; whereby,

said handgrip moves in a reciprocal path of travel.

12. (Original) The assembly of claim 11, wherein said first link includes a rocker arm

portion which projects therefrom in an angled relationship, and wherein said connector link is

pivotally joined to said first link through said rocker arm portion.

13. (Original) The assembly of claim 12, wherein said first pivot point is disposed at

the vertex of an angle formed by the rocker arm portion and the remainder of the first link.

- 14. (Original) The assembly of claim 11, wherein the location of said first junction point is adjustable relative to the first link or the connector link.
- 15. (Original) The assembly of claim 11, wherein the location of said second junction point is adjustable relative to the second link or the connector link.
- (Original) The assembly of claim 11, wherein the location of the first pivot point is adjustable relative to the first link or the first frame portion.
- (Original) The assembly of claim 11, wherein the location of the second pivot
 point is adjustable relative to the second link or the second frame portion.
- (Original) The assembly of claim 11, wherein the length of the second link is adjustable.
- (Original) The assembly of claim 11, wherein the handgrip is capable of pivoting relative to the remainder of the second link.
- 20. (Original) The assembly of claim 11, wherein the first link is a swing arm which is configured to be attachable to a foot link so as to direct a first end of that foot link in a reciprocal path of travel.

Application No. 10/716,312 6 Docket No.: LMR-12002/16 Amendment dated October 11, 2006

Reply to Office Action of September 11, 2006

21. (Original) An arm motion assembly for an exercise device, said assembly

comprising:

a first link pivotally affixed to a first frame portion of the exercise device at a first pivot

point to that said first link is capable of reciprocal motion about said first pivot point;

a second link pivotally affixed to a second frame portion of the exercise device at a

second pivot point separated from said first pivot point, so that said second link is capable of

reciprocal motion about said second pivot point;

a connector link which extends between said first link and said second link, said

connector link being pivotally joined to said first link at a first junction point, and to said second

link at a second junction point so that when one of said first links and said second links

reciprocates about its respective pivot point, said connector link causes the other of said first and

second links to pivot about its respective pivot point; and

a handgrip which is affixed to one of: said first link, said second link, and said connector

link.

22. (Original) An exercise device having an improved arm action, said exercise

device comprising:

a frame having a first pivot axis defined thereupon:

a foot link having a foot receiving portion which is configured to support a user's foot;

a coupler for coupling a first end of the foot link to the first pivot axis so that said first

end of said foot link is directed to travel in an arcuate path;

Application No. 10/716,312 7 Docket No.: LMR-12002/16

Amendment dated October 11, 2006 Reply to Office Action of September 11, 2006

apri to other reach of population 11, 2000

a guide operable to direct a second end of the foot link in a reciprocal path of travel as

said first end travels in said arcuate path;

a first link which comprises a swing arm pivotally supported by the frame at a first pivot

point defined on said frame;

a second link which comprises a control link pivotally supported by said frame at a

second pivot point defined on said frame and spaced from said first pivot point; and

a connector link which extends between said swing arm and said control link, said

connector link including a handgrip portion, said connector link being pivotally joined to said

swing arm at a first junction point, and to said control link at a second junction point; so that

when said swing arm reciprocates about said first pivot axis, and said control link pivots about

said second pivot axis, said handgrip moves in a reciprocal path of travel.

23. (Original) The exercise device of claim 22, wherein said guide comprises a ramp.

24. (Original) The exercise device of claim 22, wherein said guide comprises a

portion of said swing arm.

25. (Original) The exercise device of claim 22, wherein said swing arm is in

mechanical communication with said foot link so that said swing arm reciprocates about said

first pivot point when said second end of said foot link travels along said reciprocal path.

Reply to Office Action of September 11, 2006

26. (New) An arm motion assembly for an exercise device as described in claim 11, said arm motion assembly being configured so that when a user is using said exercise device and gripping said handgrip, the user's hand travels along a path of motion which is generally inclined relative to the horizontal so that the user's arm pivots primarily at the shoulder joint.
